ABSTRACTED-PUB-NO: WO2003024370A

BASIC-ABSTRACT:

NOVELTY - The prosthesis shaft (2) has a dimensionally stable wall (7) which has an outward pointing outer side (9) and an inward-pointing inside (8). A dimensionally stable shaft-base (11), together with the wall, forms a beaker-shaped interior (12) which is accessible from outside via an insertion opening (13) for inserting a leg-stump. A chamber (15) is positioned away from the shaft-base on the inside of the shaft-wall and extends in the peripheral direction of the shaft. A wall (18) made of clinging, air-impervious material seals off the interior from the stump and lines the interior of the shaft. At least one pressure-equalizing duct (23) has one end in the chamber, and the other end is connected to a pressure chamber.

USE - Prosthesis shaft containing an amputated stump

ADVANTAGE - The prosthesis shaft is well sealed by a lining from the stump without high pre-tensioning forces being required

DESCRIPTION OF DRAWING(S) - The drawing shows a longitudinal section through a thigh bone prosthesis with prosthesis shaft.
